

HOST-BASED WIRELESS INTRUSION DETECTION SYSTEM

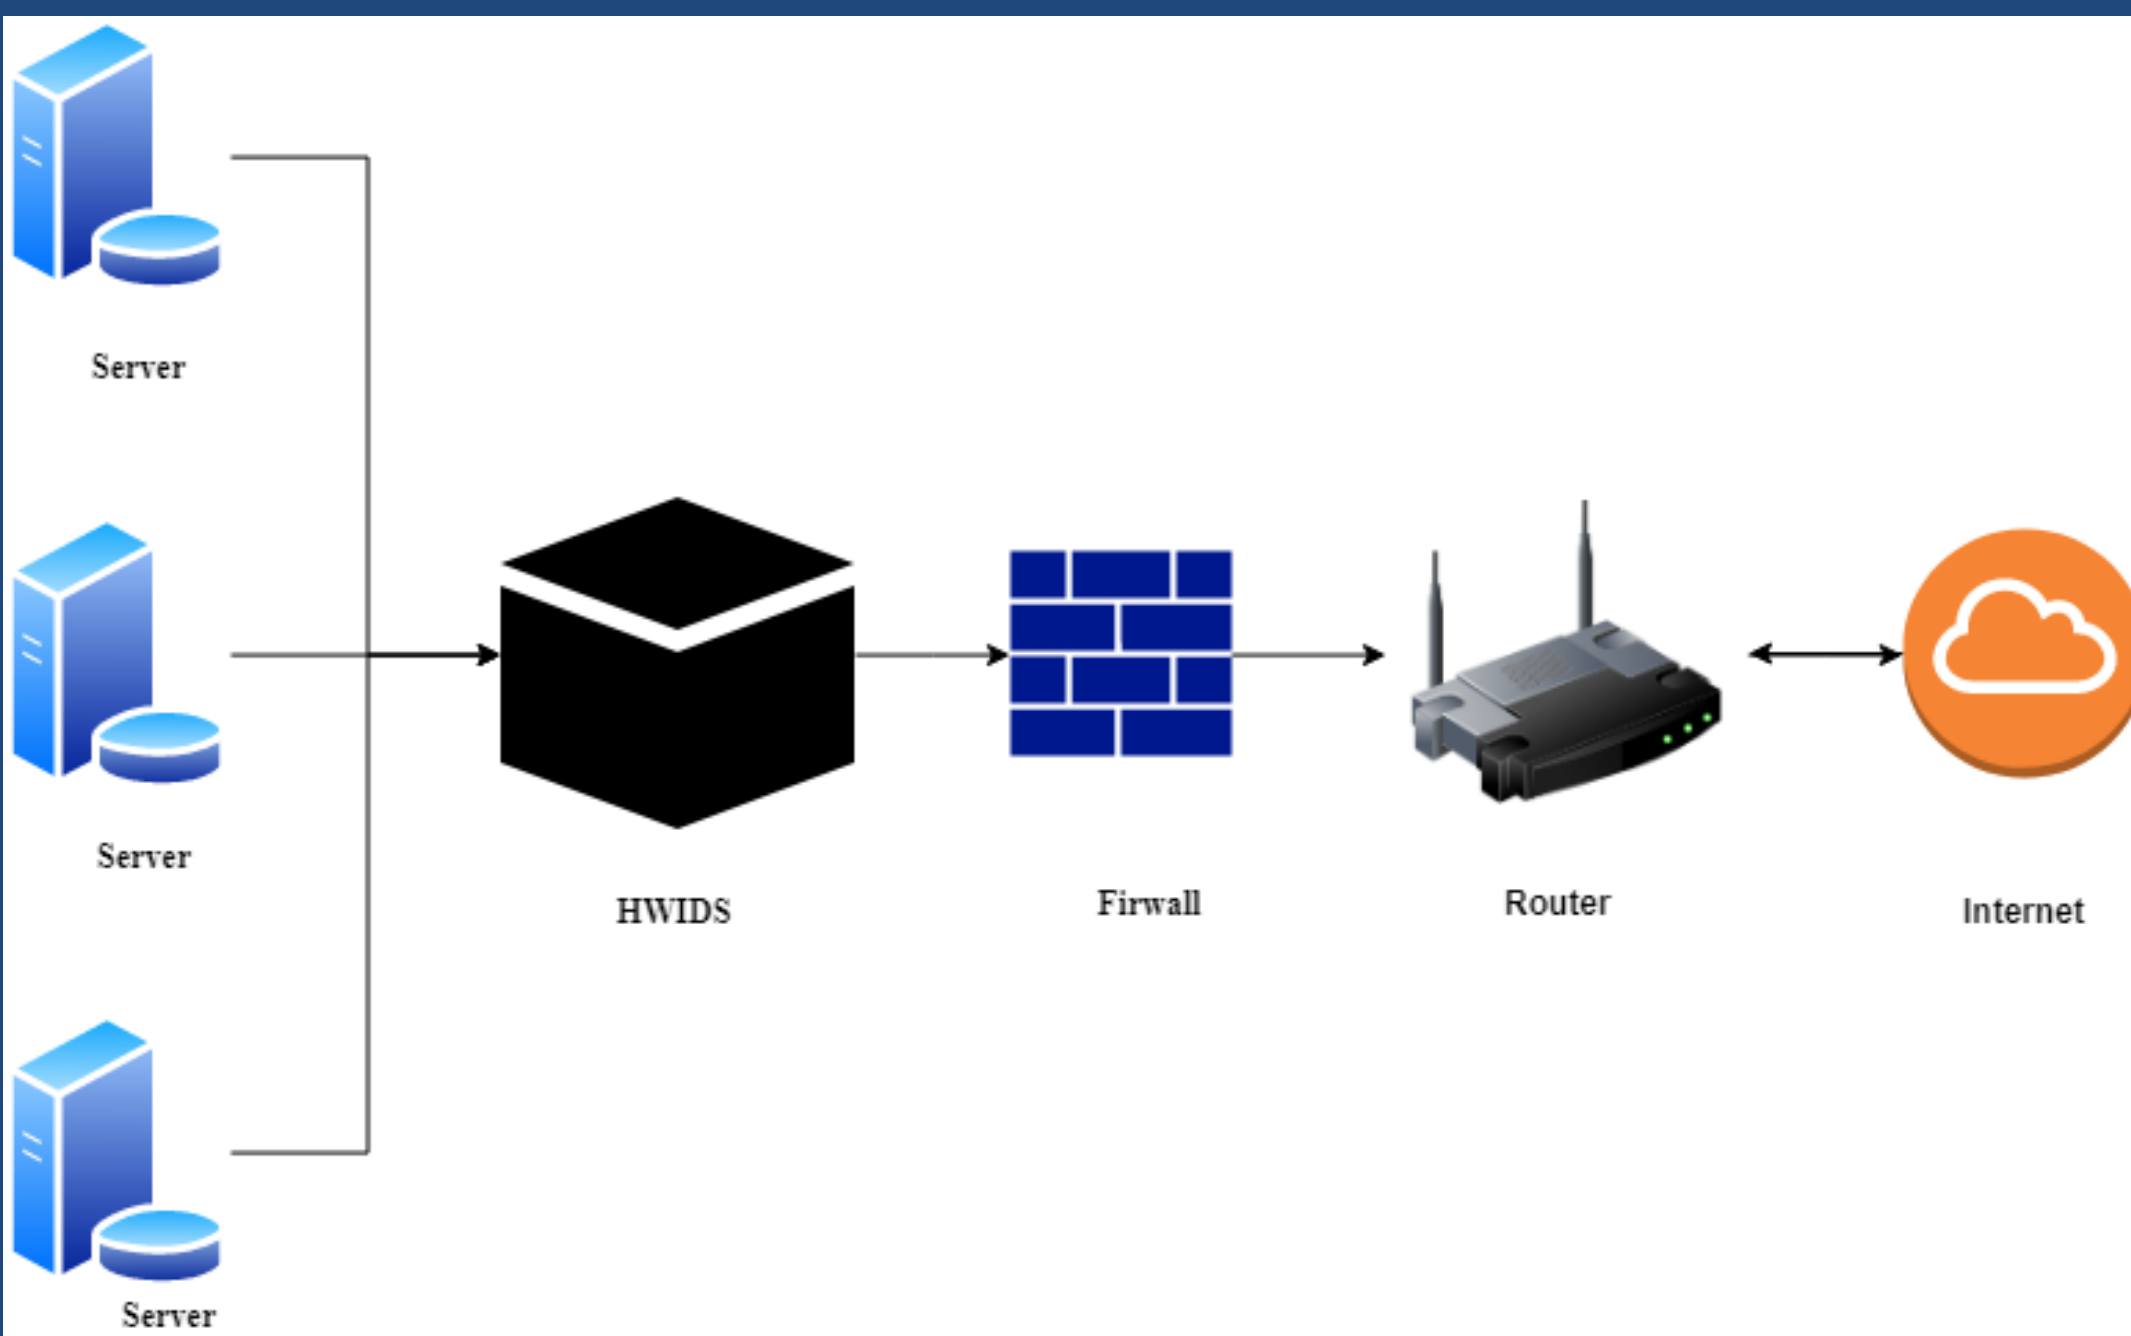

AIM

The aim of this research project is to design and implement a user-friendly host-based intrusion detection system that will help the user to detect unwanted attack coming in a network. Reviewing the current intrusion detection system, data analysis, design appropriate system architecture for a host-based wireless intrusion detection system. Besides that, implementing the system to prevent the attacks in the network and to find out the suspicious activities in the networks

Objective

- To investigate the existing approach that used for a host-based intrusion detection system
- To develop a host-based wireless IDS
- To evaluate a host-based wireless intrusion detection system

METHODOLOGY

SIGNIFICANCE OF THE PROJECT

This project seeks to assistance the comprehension of HWIDS and intrusion prevention system technologies and in designing, implementing, arranging, verifying, monitoring, and maintaining IDS and prevention system.
